Current Workflow

The current workflow relies heavily on manual reading, searching, memory, and individual judgement. The opportunity is to make context and evidence easier to find—not to remove human accountability.

PAIN POINTS & ROOT CAUSES

PAIN POINT	Important risks are buried in long contracts.	Related documents may be missing or hard to locate.	Entity or governing-law mismatches may be missed.	Past negotiation decisions are difficult to reuse.	Obligations and deadlines may not become tracked actions.
Root-cause hypothesis	A structured risk checklist is not reliably applied to every review.	The contract and supporting documents may not be linked in one reliable view.	Entity selection and jurisdiction checks are not consistently surfaced at review time.	Historical notes are incomplete and not a fully authoritative source of policy.	Terms may not consistently become an owner, due date, evidence requirement, and escalation.
Evidence	Project framing; checklist described as incomplete.	Example: Harrington Health Systems MSA may need a BAA.	Example: TravelHub has a potential US-entity mismatch for a UAE client.	Reconstructed notes are incomplete/unreviewed; distinguish preferences, exceptions, and rejected positions.	Treat as a workflow hypothesis to validate; do not imply every obligation is missed.

Root-cause statement: Contract review is fragmented across documents, manual interpretation, and incomplete historical context. This can make material risks harder to identify consistently and explain with evidence.

AI OPPORTUNITY MAP

User need	Understand a long contract quickly	Spot material risk	Reuse historical decisions	Reduce repeated manual work
	Check entity and jurisdiction	Find missing supporting documents	Make next action clear	
Potential AI capability	**Summarize parties, contract type, key dates, commercial terms, and important clauses.**	**Compare party/entity details and governing-law fields with configured AtliQ rules.**	**Prioritize findings and suggest verify, request document, negotiate, or escalate.**	**Retrieve similar prior contracts and negotiation notes; distinguish accepted, rejected, and exceptional positions.**
	Flag clauses such as uncapped liability, unusual indemnity, restrictive terms, or defined checklist risks.	**Identify possible document requirements based on contract type or configured rules, such as a BAA or DPA.**	**Create a consistent review report and audit trail.**	
Human control (Limitations)	Reviewer checks summary against the source document.	Every finding links to source evidence; reviewer decides materiality and response.	Rules must be confirmed by the business; uncertain cases are escalated.	Measure actual time saved and error rates during pilot.
	AI reports a possible gap, not a legal conclusion; reviewer verifies applicability.	Historical notes are not automatically treated as policy; incomplete notes are labelled uncertain.	No autonomous approval, signing, or binding negotiation.	

Opportunity Statement - Turn contract review from a manual search-and-interpret task into a guided workflow that surfaces prioritized issues with evidence, context, uncertainty, and a clear human next step.
